Faculty of Technology, Arts and Culture (TAC)
Coursework Brief 2026/27

Module name:	**Web Application Development**
Module code:	**CTEC2712**
Title of the Assessment:	**Web Project**
This coursework item is:	Summative
This summative coursework will be marked anonymously: ***(delete as appropriate)***	No

The learning outcomes that are assessed by this coursework are:

1. Demonstrate a critical understanding of information architecture, user interface design and usability principles.
2. Effectively apply knowledge of client-side web development technologies.
3. Effectively apply knowledge of server-side web development technologies.
4. Demonstrate a critical understanding of security protocols in web applications.

This coursework is:	Individual

Although you may work on code in groups, the video submission is individual.

This coursework constitutes 60% **of the overall module mark.**

Date Set:	**31/08/2026**
Date & Time Due (the deadline):	**09/10/2026 at 11:59 PM**
In accordance with the University Assessment and Feedback Policy, your marked coursework and feedback will be available to you on:	**23/10/2026**

You should normally receive feedback on your coursework **no later than 15 University working days after the formal hand-in date,** provided that you have met the submission deadline

If for any reason this is not forthcoming by the due date your module leader will let you know why and when it can be expected. The Associate Head Education (archie.khuman@dmu.ac.uk) should be informed of any issues relating to the return of marked coursework and feedback.

When completed you are required to submit your coursework via:

1. Upload four videos to DMU replay / panopto
2. Submit a link to each video as a comment via learning zone portal

Late submission of coursework policy:

Late submissions will be processed in accordance with current University regulations. ***Please check the regulations carefully to determine what late submission period is allowed for your programme.***	
Academic Offences and Bad Academic Practices: Please ensure you read the section entitled “Academic Offences and Bad Academic Practice” in the module handbook or the relevant sections in this link: BaseCamp Link: Overview: Assessment and Good Academic Practices	
Tasks to be undertaken: Record four short videos, see below for details	
Deliverables to be submitted for assessment: Four short videos, see below for details.	
How the work will be marked: See rubric below.	
Module leader/tutor name:	**Haseeb Khan**
Contact details:	**hakh@nielsbrock.dk**

Web project

Assignment brief

You will submit **four short videos** introducing the following practical aspects of web development to an imagined audience of *first year undergraduates*.

1. **HTML Semantics** including examples of using common semantic elements, how they can generate landmark regions and support accessibility. Demonstrate how using appropriate elements helps to express the meaning of specific page content and supports users of assistive technology.

2. **Page layout** including the use of inner and outer display types and responsive/intrinsic design. Use a complex page as an example. Demonstrate how deeply nested elements are positioned and controlled in layers using a variety of different display types.

3. **HTTP semantics** including examples of different request methods and response status codes. Show user interaction with hypermedia controls and use the browser developer tools to help explain the communication between the client and the server.

4. **Application architecture** including HATEOAS, routing and MVC. Demonstrate how a web application serves HTML documents with embedded hypermedia controls which enable navigation between routes. Show how your high-level application design provides the user with access to a range of functionality.

Each video must be **three minutes (plus or minus 15 seconds).** in length.

> This assignment is worth 60% of the module mark, 15% per video.

Video structure

The short video format is intended to be challenging. Your task is to articulate the concepts with clarity within the time limit.

> Think of it as an educational social media video, aimed at someone like you.

You are free to structure your videos as you like. You should probably take some time planning out how many seconds to use for each component of the video. Its important to make sure each component is given an appropriate allocation of time. Time is precious, don't waste it.

We expect each video to be focused on practical demonstrations of the abstract concepts. The concept should be explained, but try to link the explanation to practical examples as much as possible. Crucially, you are expected to use your own running application as a source of relevant examples.

> We are looking for clear explanations, carefully selected code examples and insightful demonstrations.

Remember, your audience is engaged and interested but you cannot assume deep specialist knowledge. Introduce your terms before using any web development jargon. Keep the narration as focussed as possible on explaining the key aspects of what is happening in the demonstration and linking this to the more general concepts. Choosing what to leave out is as important as choosing what to include.

Video editing is possible (see below). Producing a good result may require a few attempts. It's a good idea to create some practice videos well before the deadline so you understand the process.

Tools

When recording your videos we will expect you to use the following tools as a minimum:

- A working application (optionally with terminal output)
- A code editor
- A web browser (with developer tools)

If you wish you can *briefly* show diagrams or images for a few seconds to help explain the concepts, but the primary content should be your commentary and a practical demonstration.

> We expect to see you interact with the running application in the browser and explain what is happening with reference to specific code.

A working application

You will need to *clearly demonstrate* the operation of a working web server. So you will be expected to have a running application.

> Don't waste time explaining how to set up and serve your application, just make sure the application is running before you start recording.

You may want to show console output from the server in a terminal if you choose to use logging to demonstrate what is going on.

> Make sure we can see what you are talking about. If you show the terminal output then make sure you explain the logging code.

In practice, the application will probably be running in an integrated VSCode terminal. Although there are alternatives and you are free to choose as long as we understand what you are showing.

A code editor

You will need a code editor to display the source code which you are explaining. We are expecting to see clear evidence that you are well prepared and intimately familiar with the code.

> Consider the font size, the audience must be able to comfortably see the relevant code in context.

You should make sure you **refer to specific code using the cursor** to highlight specific files, functions, expressions, variables etc. as necessary, showing the logical pathways as part of your explanation.

> Simply reading from a script will not be acceptable, we **must** see that you connect your narration to the code being shown on screen.

A web browser

You will be expected to use a web browser to demonstrate the user-facing application and to show how the client side of the application is operating behind the scenes using the browser developer tools.

For example, the developer tools *network* panel will be critical for showing details of HTTP traffic. The *elements* panel (including the accessibility tree) may be a good way to show how page content is structured. It can also be used to modify the CSS by toggling individual styles.

In most browsers, CSS rules can be toggled on and off with the associated check box in the developer tools CSS view. This can be an effective way to demonstrate how a page design works.

> Tip: If you convert an individual CSS rule into a *comment* in your source code, it will appear deselected in the developer tools and can be toggled back on. Toggling selected rules one-by-one in a carefully chosen order can reveal the logic clearly with good narration.

Steps to submission

There are four videos to produce. A three minute video can take several hours or days to prepare and record. You should begin preparation for your assignment submission as soon as possible to give yourself the best chance of producing something that properly reflects your ability.

Understand the recording process

It may be useful to go through a trial run of recording a video. Just to understand the (creative and practical) processes involved. So pick a video, create a rough plan on paper and **record a rough draft**. It should help you to create a much better plan.

> You can do it badly, without much planning at first. This is much better than leaving it to the last minute.

Any half-serious attempt will focus your mind on the details. You will learn how long it takes to explain each concept. Is the video too long or too short? You will quickly discover which parts need to be removed and what is missing. You may need to do some research or tweak the code before trying again.

> Getting an early start is really important. You may record the same video many times, refining the plan with each attempt, before you produce something you are happy to submit.

Planning a video

You should prepare carefully for each recording, being selective in terms of what you choose to include. Part of the challenge here is to keep it brief, you only have

~180 seconds to play with.

> Work out how much you can say in ten seconds. How long does it take to demonstrate the core points?

Break the available time up into smaller chunks and create a plan. We are not expecting you to simply read from a script, but preparing a set of bullet points or short notes as a guide may help. Only include the absolutely necessary information.

If you need to do more research/revision or update your code, then do it in the planning phase, but don't let it stop you from recording a draft video (or several, using an iterative approach).

Recording a video

Videos can be recorded using software of your choice. If you have no preference then you can use the *DMU Replay* / *panopto* system to record your videos.

> Check the DMU replay Guides for help with Recording a video. You can create draft videos in your private "My Folder"

You should plan to create a few practice videos and start as early as possible. Creating a bad video only takes a few minutes and it will help you to understand the process. Continue to make notes and update your plan based on the experience.

> Remember, you are talking to an audience of your peers. So don't try to be overly formal, explain things in a way you are comfortable with.

In a few hours you can record many different versions of a three minute video. Watch them back and take notes. Iterate towards the best result you can. You can delete them and try again as necessary.

Pay attention to the length. You will lose marks for a video over 195 seconds or under 165 seconds.

> If you are comfortable with editing then you can leave long pauses in and keep going if you make mistakes,

Editing a video

Though it is not essential, you should consider leaving time for an editing phase so you can refine your videos and/or reduce their length as necessary.

If you are using *panopto* then editing a video is quite simple.

> If you have chosen different software to record then you can upload videos to your panopto "My folder" for editing. Or, use whatever video editing software you like before uploading.

Watch Your videos. Edit out any unhelpful bits. Consider stitching multiple videos together if you are comfortable doing so.

> If editing isn't your thing, you can always record again. Three minutes is not a long time.

Remember your audience. We are assessing your ability to accurately communicate the core concepts to an audience of undergraduates like you. *If you don't understand it when you watch it back, maybe you should edit it out or re-record?*.

Finalising a video

This step is important to get right. When you are happy with a video, rename it with your p-number and the correct video number (1 - 4).

> To you, it should look something like this. e.g.
>
> - P12345678_video_1
> - P12345678_video_2
> - P12345678_video_3
> - P12345678_video_4
>
> Please use the requested naming convention, it helps us to manage the submissions.

Once the files are in place, you will need **four unique links** pointing to the four individual videos to formally submit your assignment in Learning Zone.

Learning zone submission

Submission is via **learning zone**, each video has a submission portal. To submit, simply add a link to **the correct individual video file** in the submission comment.

Submitting on learning zone is the only way to get a mark. The timestamp of your learning zone submission will count as the time of submission.

Non-submissions will be marked at 0%. Late submissions will be capped at 40%.

> **Warning:** Please take care when submitting your work. If we cannot find or access a video with the link you submit then it may count as a non-submission.

Marking scheme

All four videos will be marked according to a common marking scheme. There are five criteria worth up to three marks each for a maximum of fifteen marks per video.

Planning

Videos which are well planned with get higher marks. Total video length should be between 165 and 195 seconds. Zero marks will be given for videos outside this range. For videos within the limits:

- Is the video well structured?
- Is the time used well?
- Is there a logical flow?
- Is the pace OK? Neither really fast, nor really slow?

Presentation / clarity

Videos should be clear, with good audio and video. We should be able to see what you are showing and hear what you are saying and the two should work well together. If we cannot see (e.g. font size is too small) or hear (e.g. background noise or muffled audio) then marks will be lost.

- Is the audio clear and make sense?
- Is the video clear and make sense?
- Does the audio narration match what's happening in the video?

Demonstration / Concrete examples

Videos must include a practical demonstration using your own application code. However, you can't explain an entire application in a video, so your task is to select appropriate aspects of your application to demonstrate and explain.

- Did you use tools appropriately?
- Did you explain the relevant details of specific examples?
- Did you choose appropriate examples that demonstrate the concepts fully?

Explanation / general concepts

The point of each video is to explain a more abstract concept using your application as a concrete demonstration. Marks are available for this explanation of the abstract concept.

- Did you understand the question?
- Did you provide an accurate explanation of the general concepts?
- Was your explanation complete?

Articulation / Fluency / effectiveness

This criteria is intended to capture an overall picture of how effective the video is at communicating to the intended audience.

- Fluency and overall understanding.
- Did you link the general concepts to the specific examples?
- Are you convincing as an expert?
- Is it useful for the intended audience?

> Each category will be awarded up to three marks as follows:
>
> 3 marks = fully addressed
> 2 marks = mostly addressed
> 1 marks = partially addressed
> 0 marks = Not addressed
>
> Giving a potential total of 15 marks per video and 60 marks overall.
